Swipe to know more →

Command	Command	Example Usage
<code>Stack()</code>	Create an empty stack	<code>stack.clear()</code>
<code>push(item)</code>	Add an item to the top of the stack.	<code>stack.push(10)</code>
<code>pop()</code>	Return the topmost item from the stack without removing.	<code>popped_item = stack.pop()</code>
<code>peek()</code>	Return the topmost item from the stack without removing.	<code>top_item = stack.peek()</code>
<code>is_empty()</code>	Check if the stack is empty.	<code>if stack.is_empty():</code>
<code>size()</code>	Return the number of elements in the stack.	<code>stack_size = stack.size()</code>

Command	Command	Example Usage
<code>clear()</code>	Remove all elements from the stack.	<code>stack.clear()</code>
<code>copy()</code>	Create a shallow copy of the stack.	<code>new_stack = stack.copy()</code>
<code>search(item)</code>	Return the 1-based position of the item in the stack.	<code>position = stack.search(5)</code>
<code>o_list()</code>	Convert the stack to a list.	<code>stack_list = stack.to_list()</code>
<code>from_list(lst)</code>	Create a stack from a list.	<code>stack = Stack.from_list([1, 2, 3])</code>
<code>extend(iterable)</code>	Add elements from an iterable to the stack.	<code>stack.extend([4, 5, 6])</code>
<code>remove(item)</code>	Remove the first occurrence of the item from the stack.	<code>stack.remove(5)</code>

Command	Command	Example Usage
<code>count(item)</code>	Count the occurrences of an item in the stack.	<code>num_occurrences = stack.count(3)</code>
<code>copy()</code>	Reverse the order of elements in the stack.	<code>stack.reverse()</code>
<code>insert(index, item)</code>	Insert an item at the specified index in the stack.	<code>stack.insert(2, 8)</code>
<code>top_n(n)</code>	Return the top n items from the stack.	<code>top_three = stack.top_n(3)</code>
<code>pop_n(n)</code>	Remove and return the top n items from the stack.	<code>top_three = stack.pop_n(3)</code>
<code>swap()</code>	Swap the positions of the top two items in the stack.	<code>stack.swap()</code>
<code>merge(stack2)</code>	Merge another stack on top of the current stack.	<code>stack.merge(stack2)</code>

Command	Command	Example Usage
<code>split(index)</code>	Split the stack into two at the specified index.	<code>stack2 = stack.split(2)</code>
<code>sum()</code>	Return the sum of all elements in the stack.	<code>total_sum = stack.sum()</code>
<code>max()</code>	Return the maximum element in the stack.	<code>max_item = stack.max()</code>
<code>min()</code>	Return the minimum element in the stack.	<code>min_item = stack.min()</code>
<code>average()</code>	Calculate the average of all elements in the stack.	<code>avg = stack.average()</code>
<code>contains(item)</code>	Check if the item is present in the stack.	<code>if stack.contains(7):</code>
<code>is_sorted()</code>	Check if the elements in the stack are sorted.	<code>if stack.is_sorted():</code>

Command	Command	Example Usage
<code>is_equal(stack2)</code>	Check if two stacks are equal (have the same elements).	<code>if stack.is_equal(stack2):</code>
<code>is_subset(stack2)</code>	Check if stack2 is a subset of the current stack.	<code>if stack.is_subset(stack2):</code>
<code>is_disjoint(stack2)</code>	Check if two stacks have no common elements.	<code>if stack.is_disjoint(stack2):</code>
<code>unique()</code>	Remove duplicate elements from the stack.	<code>stack.unique()</code>
<code>rotate(places)</code>	Rotate the elements in the stack by a specified number.	<code>stack.rotate(2)</code>
<code>shuffle()</code>	Randomly shuffle the elements in the stack.	<code>stack.shuffle()</code>
<code>sort()</code>	Sort the elements in the stack in ascending order.	<code>stack.sort()</code>

Command	Command	Example Usage
<code>sort_reverse()</code>	Sort the elements in the stack in descending order.	<code>stack.sort_reverse()</code>
<code>index(item)</code>	Return the 0-based index of the first occurrence.	<code>idx = stack.index(3)</code>
<code>reverse_search(item)</code>	Search for an item starting from the top of the stack.	<code>position = stack.reverse_search(2)</code>
<code>stringify(separator)</code>	Convert the stack elements to a string with separator.	<code>stack_str = stack.stringify(", ")</code>
<code>serialize()</code>	Serialize the stack to a string representation.	<code>serialized_stack = stack.serialize()</code>
<code>deserialize(string)</code>	Deserialize a string to create a stack.	<code>stack = Stack.deserialize(serialized_stack)</code>
